

A great fertilizer like this only comes around once every 90-100 days.

Why fertilize your turf every month? With LuxaCote® controlled release fertilizer, you can give your spreader a rest for up to 120 days. And you'll still get beautiful results: thicker, fuller and greener turf.

The secret is LuxaCote's patented prill.

At the center of each prill is nitrogen, coated with other critical ingredients for quality turf: phosphorus, potassium, iron and magnesium.

When the prill is activated by water, the nitrogen core mixes with the coating. Over the next few months, the mixture is slowly, evenly released into your turf for uniform growth, unaffected by excessive moisture or soil pH. Even slicing the prill when you mow won't hurt it.

There's no irritating dust during application. And no need to spread additional nutrients and minors month after month to get lush turf—something you'll have to do if you choose one of the other long-lasting brands. They only offer controlled release nitrogen.

No plastics.

LuxaCote is the only complete, controlled release fertilizer without a plastic coating. It's 100% pure elemental fertilizer, period. So the whole prill will dissolve in up to 120 days with no waste—no plastic coating residue hanging around in your turf for years to come.

No comparison.

You won't find another fertilizer—not even the old Scotts—with all the advantages of LuxaCote. That's a great reason to come around to our prill, wouldn't you say?
